## Program Information

The Dairy Scheme has been designed to assist laboratories with the monitoring of their Food Safety Plans for the analysis of phosphatase levels in pasteurised milk and/or presence of antibiotics. Organisations with microbiological testing capabilities are recommended to join relevant components of either the Food Microbiology Scheme, or Check Sample Program

Operating over twelve months, the scheme provides one round per quarter. Each round consists of three freeze dried samples per test which require reconstitution in UHT milk prior to testing.

Tests include:

- Phosphatase levels
- Presence of Antibiotics

Sample sets are dispatched on 10 February, 12 May, 10 August and 9 November.

The scheme is priced at AUD\$800, plus shipping.

If you are also interested in microbiological testing programs, please contact IFM to obtain more information.
